Correlações intercepto-inclinação

$$\alpha < \alpha'$$

$$\beta > \beta'$$

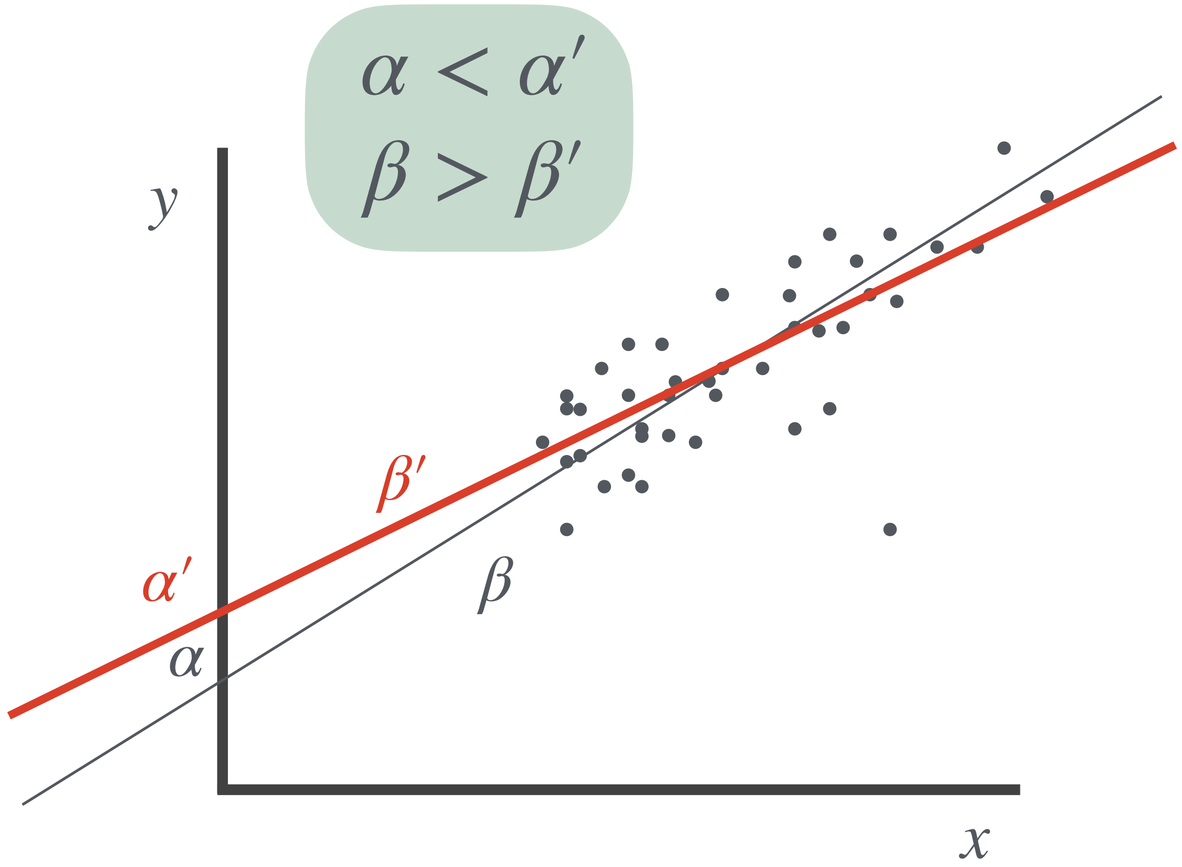

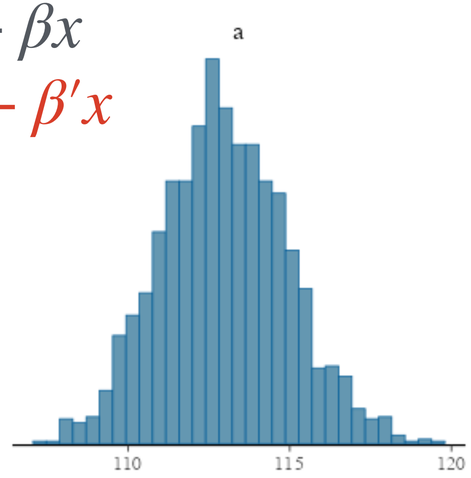

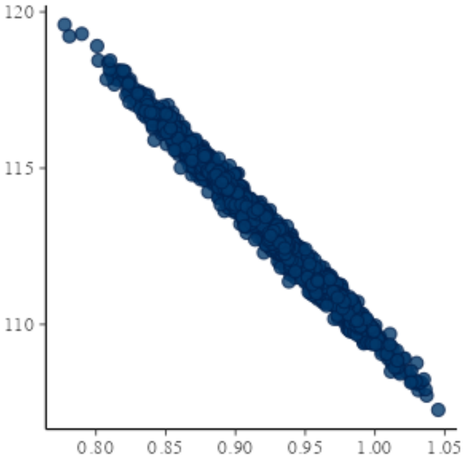

$$y = \alpha + \beta x$$

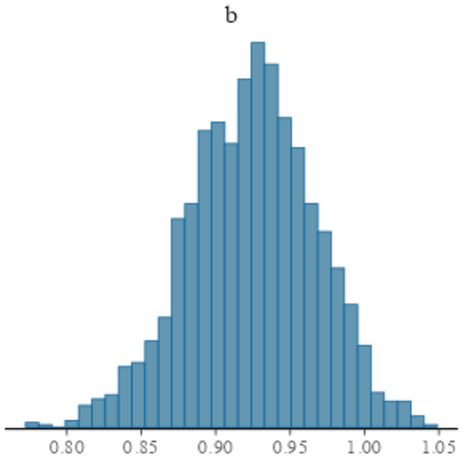

$$y = \alpha' + \beta' x$$

Correlações intercepto-inclinação

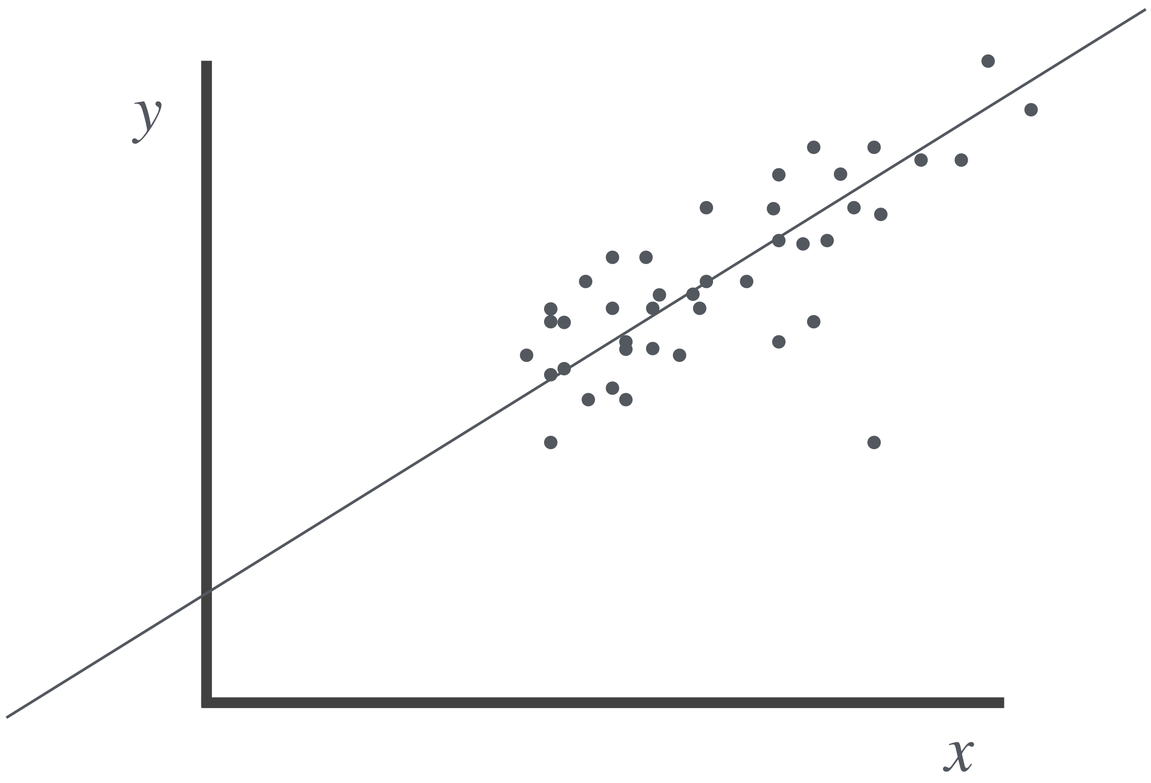

Eliminando as correlações

Modificando o modelo para melhorar a amostragem

$$y = \alpha + \beta x$$

Scaling and shifting parameters can help with convergence

- Centering both x and y values
- Scaling x to unit variance

$$\tilde{y}_i = y_i - \bar{y}$$

$$\tilde{x}_i = \frac{x_i - \bar{x}}{sd(x)}$$
