

Biomass by diameter

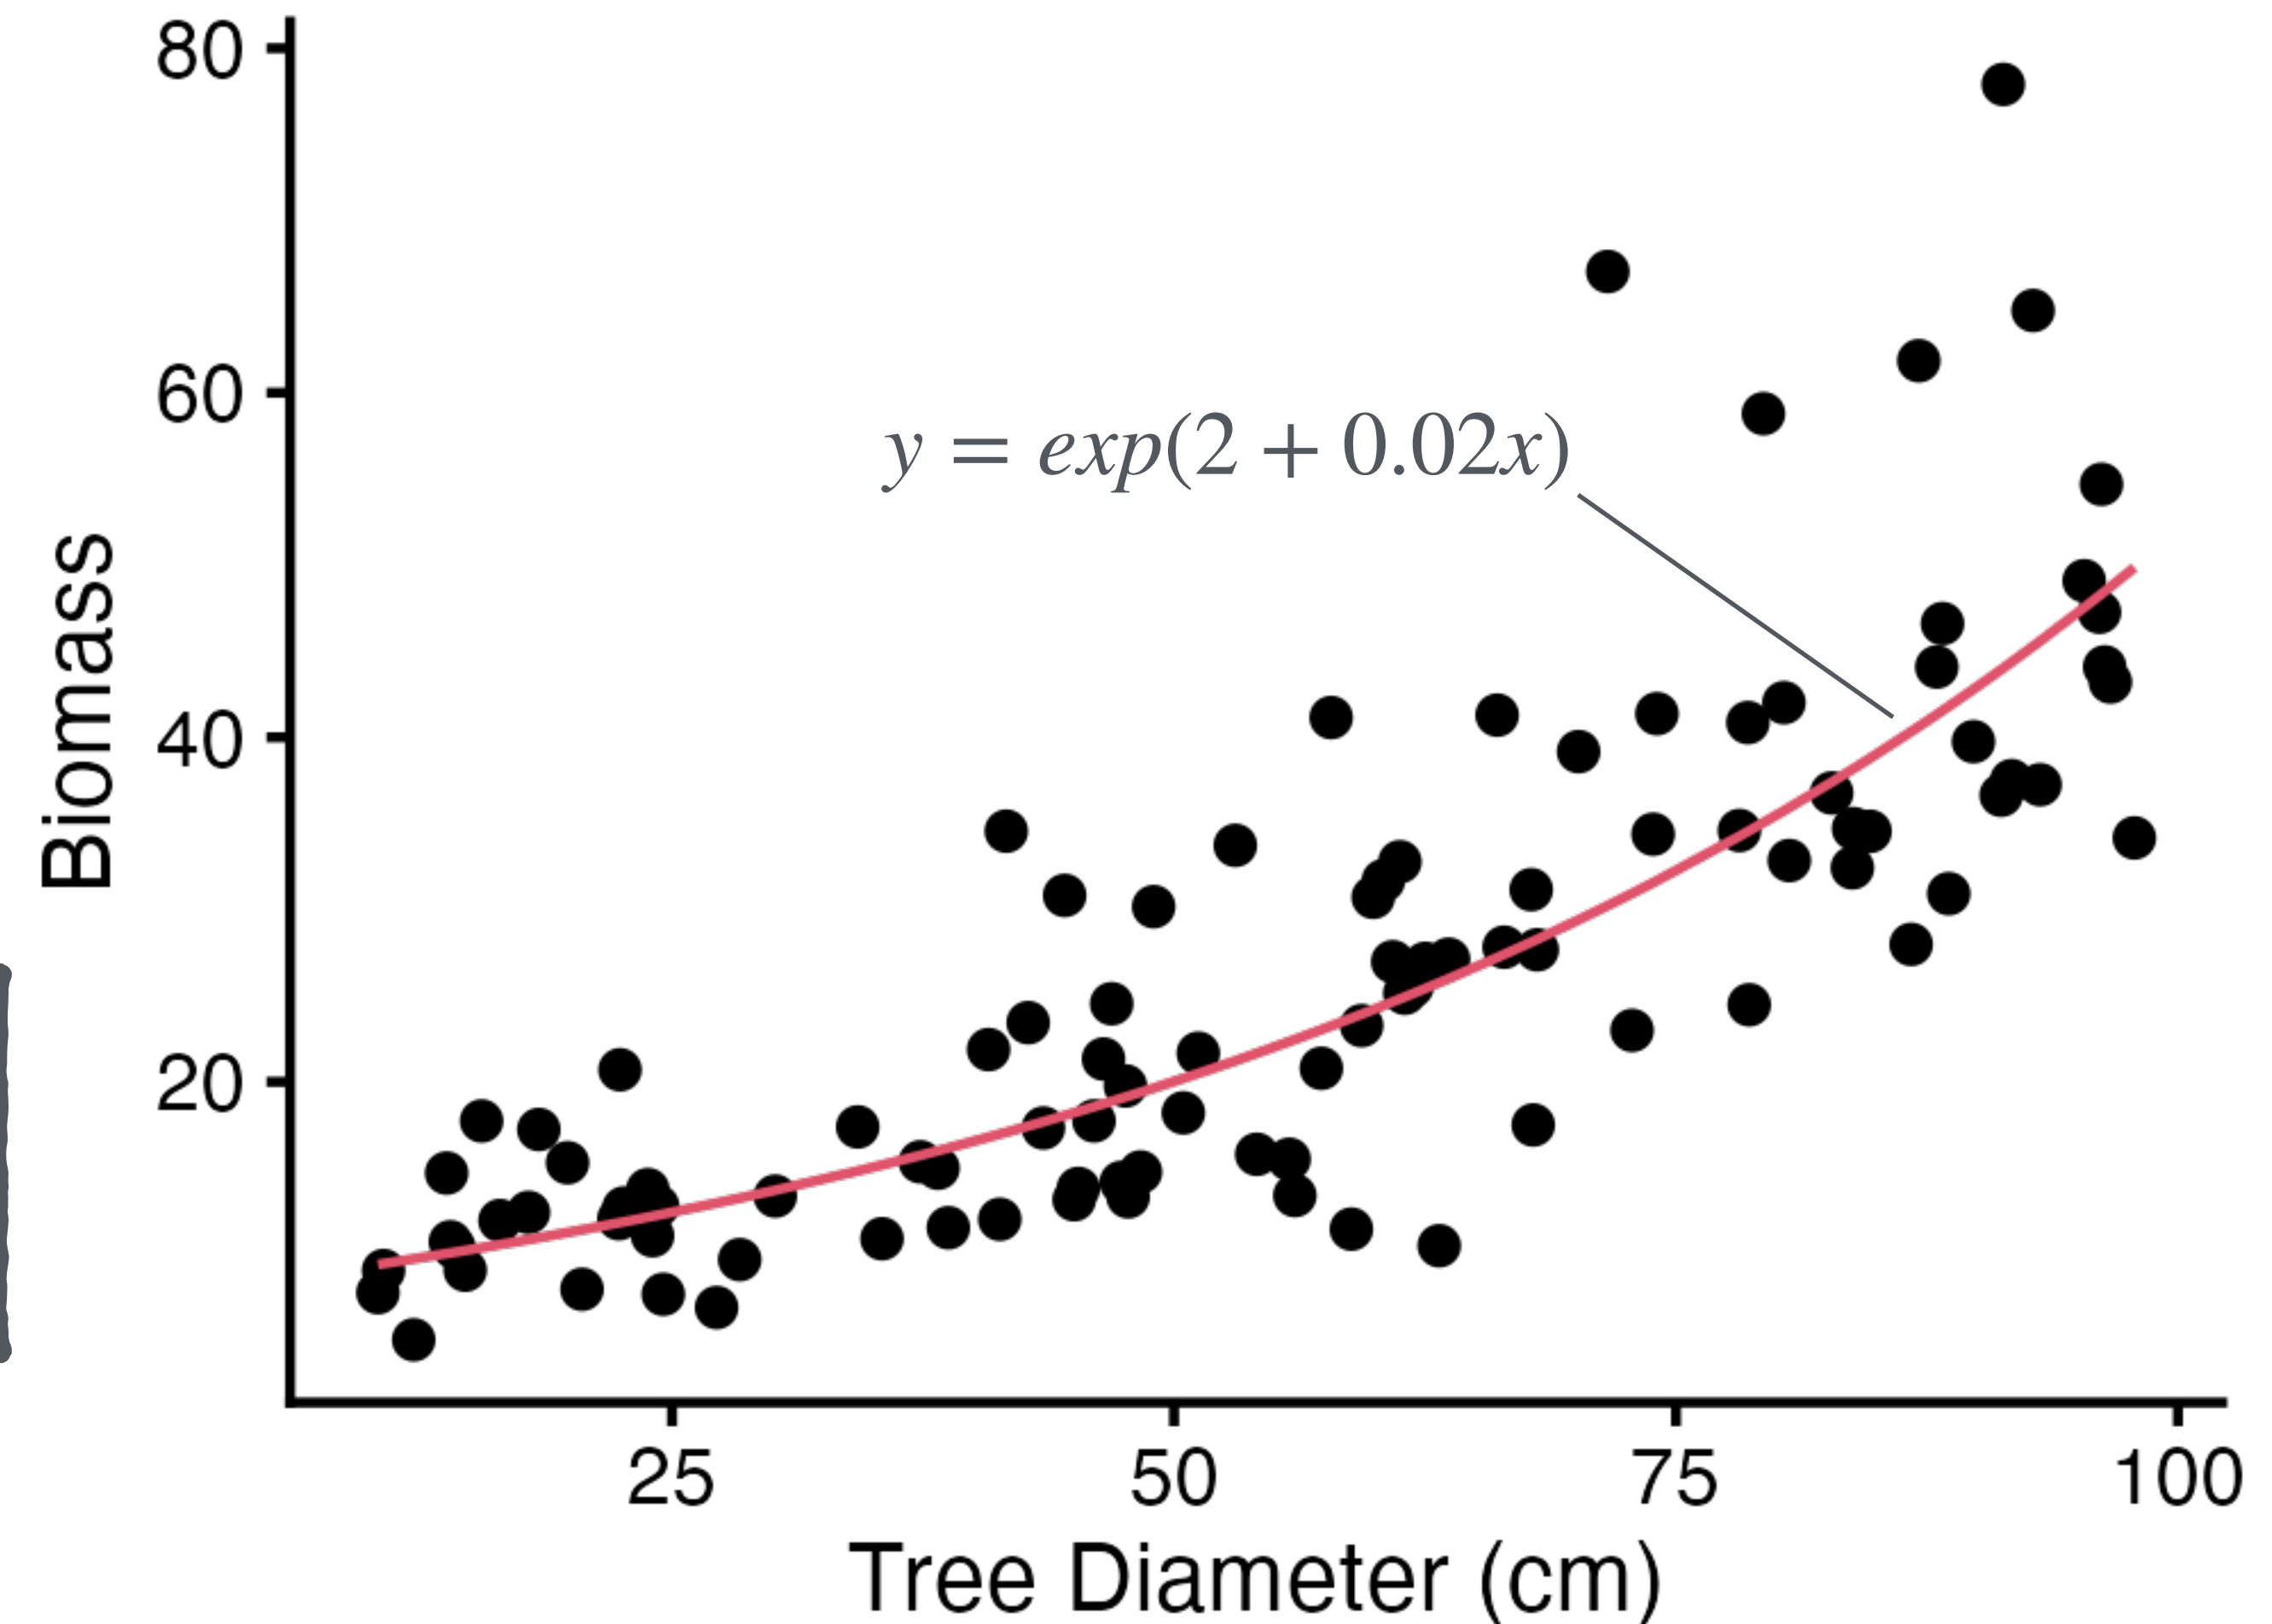

Example of non-linear relation

Option 1: log-transform y

```
df = data.frame(diameter, biomass)
fit = lm(log(biomass) ~ diameter,
         data = df)
```

Option A: Assign y a log-normal likelihood

```
rt_fit = quap(alist(
  biomass ~ lognormal(mu, sigma),
  mu <- a + b*diameter),
  data = df)
```
